Circuit diagrams - Releases

Note: It is not necessary to connect the terminal 12 to carry out the tripping. The terminal 12 is used only in order to know the tripping of circuit breaker caused by release (for example by an indicator light)

ACCESSORIES AND AUXILIARIES FOR MODULAR CIRCUIT BREAKERS MTC-MT-MTHP-MDC

For each circuit breaker it's possible to fit up to max 2 accessories. The shunt trip releases or under voltage releases must be positioned to the left of the accessories, as shown in the figure.

If 2 auxiliary contacts are used, it is necessary to observe the connection rules shown in the table below.

POS. 2	POS. 1

GW 96 006 GW 96 009s	

GW 96 009c: open/closed auxiliary contact set
GW 96 009s: tripped relay auxiliary contact set

ACCESSORIES AND AUXILIARIES FOR RCCB'S IDP

RCCB's for IDP 2P-4P up to 100 A (except for the B type)

It is possible to couple until 2 accessories for each RCCB. The shunt trip releases or the under voltage releases must be set at the right end of accessories as shown in the figure below.

RCCB's 4P 3 modules

It is possible to couple until 2 accessories for each RCCB. The shunt trip release must be set at the right end of accessories as shown in the figure below.

RCCBS's 125A and B type

It is possible to couple until 1 accessory for each 2P and 4P RCCB.

GW 96 764 POSITION CONTACT

GW 96 765 POSITION AND/OR FAULT INDICATOR CONTACT

TECHNICAL DATA FOR SHUNT TRIP RELEASES:

Pick-up current:	(A)	1.4 (230V)
Max cable section:	(mm ²)	2.5

TECHNICAL DATA FOR UNDER VOLTAGE RELEASES:

Min. reset voltage:	(V)	0.8 Ue
Release trip:	(V)	0.5 Ue
Holding power:	(VA)	3 (230V) - 5 (400V)
Max cable section:	(mm ²)	2.5

NOTE: For the auxiliary contact GW 96 765, the changeover contact 14-11-12 signals only position status (open-closed) while the changeover contact 22-21-24 is configurable which signals the tripped status for fault or the position status (open-close). The configuration of the latter changeover contact is set by means the rotation of the selector placed on the side of the product in vertical position (fault indicator) or in horizontal position (position indicator).

Type 1+2 LST circuit diagrams

SPDs 1+2 type protect electrical equipment from overvoltages due to the direct and indirect effects of lightning strikes or due to manoeuvres on electrical network supply. They provide protection for installations in areas with a high frequency of lightning strikes and are typically installed in primary distribution panels.

(*) Only for version with auxiliary contact

MODULAR ACCESSORIES

Type 2 LST circuit diagrams

SPDs 2 type protect electrical equipment from overvoltages due to the indirect effects of lightning strikes or due to manoeuvres on electrical network supply. They are suitable for installation at the beginning of electrical system, in the middle boards and next to electrical loads.

(*) Only for version with auxiliary contact

Type 1+2 LST connection

	$\text{if } P2 > 40A \Rightarrow P1 \leq 40A \text{ curve C}$ $\text{if } P2 \leq 40A \Rightarrow \text{NO protection P1}$	$\text{if } P2 > 50A \Rightarrow P1 \leq 50A \text{ curve C}$ $\text{if } P2 \leq 50A \Rightarrow \text{NO protection P1}$

Installation rules

The length of the wiring of SPD ($L1 + L2 + L3$) must be as short as possible ($L1 + L2 + L3 \leq 0,5 \text{ m}$). The surge protective devices LST can protect an electrical load placed at a maximum distance of 20m, if the load is further away, it's necessary to install an additional SPD. The minimum installation distance between two LST must be 10m.

Surge protective devices LST for PV applications

TECHNICAL DATA			
Standard	EN 50539-11, EN 61643-11

Curve:		C	
Breaking capacity EN60898 (Icn):	(A)	6000	
Coupled shunt trip releases:		GW96012	
Other features			
DIN N. modules:		5 (with MT60), 4 (with MTC60)	
Rated tightening torque:	(Nm)	4	
Cable cross sections:	Rigid	(mm²)	min 6 max 35
	Flexible	(mm²)	min 6 max 25
Degree of protection:		IP20	
Operating temperature:		(°C) -40...+60	

Circuit diagrams

SPD+POP devices protect electrical system both from voltage transients indirect (produced by discharges from lightning or switching operations on the network) to permanent overvoltages (produced by instable networks or neutral loss). When permanent overvoltages occurs, SPD+POP devices use release coil to open circuit breaker.

Instead, when transient overvoltages occurs, SPD+POP devices work as a common surge protective device without opening the circuit breaker.

Connection

Residual current relay with separate toroid

TECHNICAL DATA		
Standards:		EN 60947-2 Appendix M
Rated operating voltage (Ue):	(V)	230 a.c. Phase-Neutral / 230 a.c. Phase-Phase
Test voltage:	(kV)	2 at 50Hz (1kV per measurement circuit)
Rated frequency:	(Hz)	40-60
Type:		A
Sensitivity setting I Δ n:		30 - 50 - 150 - 230 - 300 - 350mA 0.5 - 1 - 1.5 - 2 - 3A
Delay time setting Δ t:	(s)	0 - 0.25 - 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 10
Output contact type:		1 changeover, 10A - 250V
Insulation class:		II
Power loss:	(VA)	4
Degree of protection:		IP20
Operating temperature:	(°C)	0 +55
Storage temperature:	(°C)	-20 +80
Maximum cable section:	(mm ²)	6
Sealing:		yes

Circuit diagram

ON (green LED): relay ON

FAULT (red LED): relay tripping

TEST: relay test-button

RESET: anomaly resetting

I Δ n: sensitivity setting

DELAY: delay time setting

In order to obtain the residual current protection, it is necessary the use of all these following components:

- earth leakage relay GW 96 331 (installation on EN 50022 rail)
- solid or split core current transformer (GW 96 332 ÷ GW 96 337)
- one release (shunt trip or under voltage release) to be used an accessory to the MCB or MCCB.

The distance between earth leakage relay and the core current transformer must be less than 20m.

Guide for using the earth leakage relay with separate toroid

In the case of power centers with large cable-section, it is possible to place the core current transformer directly on the cable which connect the star point of the MV/LV transformer to earth. Special attention must be paid for core current transformer wiring. In fact, the cables must be as centred as possible inside the core current transformer, to prevent untimely tripping of the relay when there are high rated currents circulating in the cables (because these currents could cause localised magnetic saturations).

UTILIZATION CATEGORIES

The table below shows a brief description of each utilization category according to EN 61095. For the performance of the Gewiss contactors and relays according to the utilization category, please see the application note.

CURRENT TYPE	CATEGORY	TYPICAL APPLICATIONS	
AC 	AC-1	Resistive, non-inductive or slightly inductive loads: resistance furnaces	
	AC-2	Slip-ring motors: starting, switching off	
	AC-3	Squirrel-cage motors: starting, switching off motors during running ⁽¹⁾	
	AC-4	Squirrel-cage motors: starting, plugging, inching	
	AC-5a	Switching of discharge lamps	
	AC-5b	Switching of incandescent lamps	
	AC-6a	Switching of transformers	
	AC-6b	Switching of capacitor banks	
	AC-7a	Slightly inductive loads in household appliances and similar applications	
	AC-7b	Motor-loads for household applications ⁽¹⁾	
	AC-8a	Hermetic refrigerant compressor motor ⁽²⁾ control with manual resetting of overload releases	
	AC-8b	Hermetic refrigerant compressor motor (2) control with automatic resetting of overload releases	
DC 	DC-1	Resistive, non-inductive or slightly inductive loads: resistance furnaces	
	DC-3	Shunt-motors: starting, plugging, inching Dynamic breaking of d.c. motors	
	DC-5	Series-motors: starting, plugging, inching Dynamic breaking of d.c. motors	
	DC-6	Switching of incandescent lamps	

⁽¹⁾ AC-3 and AC-7b categories may be used for occasional inching (jogging) or plugging for limited time periods such as machine set-up; during such limited time periods, the number of such operations should not exceed five per minute or more than ten in a 10-min period.

⁽²⁾ A hermetic refrigerant compressor motor is a combination consisting of a compressor and a motor, both of which are enclosed in the same housing, with no external shaft or shaft seals, the motor operating in the refrigerant.

APPLICATION NOTE

In general, the technical data of Gewiss contactors and relays refer to the AC-1 or AC-7a utilization category. If the type of electrical load doesn't belong to these categories, the current and as a consequence the power of the load, must be derated according the following table.

AC APPLICATION 						
Contactor type	CTR20 - CTRM 20	CTR25 - CTRM 25	CTR40	CTR63	RLM	RLB
Utilization category:	AC-1 / AC-7a Resistive, non-inductive or slightly inductive loads 					
Rated operational current (A):	20	25	40	63	16	16
Max operational power (kW):	230V single-phase	4	5.4	8.7	13.3	3,5
	230V three-phase	6	9	16	24	6
	400V three-phase	13	16	26	40	10,5
Electrical endurance (opening-closing)	200000		100000		200000	100000
Max operating frequency (opening-closing per hour)	600					
Utilization category:	AC-3 / AC-7b Starting and switching off 					
Rated operational current (A):	NO contacts: 9 NC contacts: 6	8.5	22	30	NO contacts: 7 NO contacts: 4	5
Max operational power (kW):	230V single-phase	NO contacts: 1.3 NC contacts: 0.75	1.3	3.7	5	NO contacts: 1,1 NO contacts: 0,55
	230V three-phase	-	2.2	5.5	8.5	1,5
	400V three-phase	-	4	11	15	3
Electrical endurance (opening-closing)	300000	500000	150000		300000	100000
Max operating frequency (opening-closing per hour)	600					
Utilization category:	AC-5 Switching of lamps 					
Max operational power (kW):	See specific table regarding switching of lamps					
Utilization category:	AC-6b Switching of capacitor banks 					
Max operational capacity (µF):	230 V	30	36	220	330	30
Electrical endurance (opening-closing)	100000					
Max operating frequency (opening-closing per hour)	600					

MODULAR ACCESSORIES

GEWISS contactors and relays can be also used for DC applications. The following table shows the values of the rated operational current depending on the rated operational voltage and the utilization category.

DC APPLICATION 							
Utilization category	Nr. poles	Contactor type					
		CTR 20 - CTRM 20	CTR 25 - CTRM 25	CTR 40	CTR 63	RLM	RLB
Max operating frequency (DC-1):		300 switching p er hour					
Electrical endurance (DC-1/DC-3/DC-5):		100.000					
Rated operational current (A)

GUIDE - HOW TO MAKE SIMULTANEOUS COMMAND OF MORE GROUPS OF LATCHING RELAYS

ACCESSORIES FOR CENTRAL COMMAND AND GROUP COMMAND			
Code:		GWD6671 ⁽¹⁾	GWD6672
Type of accessory:		It must be mounted on relay	
Rated operating voltage (Ue):		(V)	250 AC
Rated insulation voltage (Ui):		(V)	440 AC
No. of modules:			0.5
Mechanical endurance (no. of operations):		1 x 10 ⁶	-
Rated tightening torque:		(Nm)	0.8
Terminal screw type			M3
Screwdriver suggested:			PZ1
Cable section:	rigid (mm²)		1...4
	flexible (mm²)		1...4
Weight		(g)	30

⁽¹⁾ Not available for relay with DC coil

The following codes are used to make a centralized command of one or more groups of relays

Code	Type	Number	Description
GW D6 671	Accessory that must be mounted on latching relay	1 for each latching relay of the group	Carry out the ON/OFF command of two or more relays from one point, independently from the status of each relay.
GW D6 672	Stand-alone accessory	1 for each group of relay	Carry out the simultaneously command of two or more groups of centralized relays independently from the status of each relay.

GW D6 671 - CENTRALIZED COMMAND OF 1 GROUP OF RELAY

- Legend:
- **Push-button relay:** local command of relay
 - **Push-button of group:** centralized command of all group's relays, independently from the status of each relay

GW D6 672 - CENTRALIZED COMMAND OF MORE GROUPS OF RELAYS

Legend:

- **Push-button relay:** local command of relay
- **Push-button of group:** centralized command of all group's relays, independently from the status of each relay
- **Multilevel Push-button:** centralized command for all relays of all the groups, independently from the status of each relay

Load management relay P-Comfort

Storage temperature:	(°C)	-25 +70
Sound level at 10 cm:	(dB)	85

Wire version

In the event of overloading, due to the simultaneous switching ON of several electric loads, P-Comfort prevents electricity supply interruption disconnecting the non-preferential loads wired to the contact on the device.

After an adjustable time interval, P-Comfort automatically supplies non-preferential loads again.

The P-Comfort is suitable for single-phase installations with a contractual power up to 6 kW.

The device is already set with default values suit for 3 kW utilities but it is possible to change these values using the buttons placed on the front of device.

SdP: Non-priority load contact opening threshold

Adjustment power range: 0 ÷ 8 kW

Default: **3,80 kW**

ton: Contact opening delay when power threshold is exceeded and duration of the buzzer

Adjustment time range: 10 ÷ 120 seconds

Default: **45 seconds**

tof: Non-priority load contact opening time

Adjustment time range: 10 ÷ 255 seconds

Default: **90 seconds**

MODULAR ACCESSORIES

Radio frequency ZigBee version

In the event of overloading, due to the simultaneous switching ON of several electric loads, P-Comfort RF prevents electricity supply interruption disconnecting the non-preferential loads connected in radio frequency to the following devices:

- smart plug RF ZigBee (GWA1526)
- RF ZigBee actuator for flush-mounting (GWA1523)

or wired to the contact on the device.

The disconnection and connection of non-preferential loads can be set:

- by Priority (regardless of power consumption)
- by Power (depending on power consumption)

Smart plug RF ZigBee

**RF ZigBee actuator
for flush-mounting**

BIOCOMFORT (Main disconnection switch)**DESCRIPTION****Principle of operation**

The main disconnection switch (also known as a "biocomfort switch") disconnects the alternating voltage from the electrical system downstream when all the loads in the sleeping area that are connected to it are switched off. It is not necessary to manually adjust the relay tripping threshold because the main disconnection switch, thanks to the innovative self-learning function, automatically learns the value of the current absorbed by the loads and applies it as the tripping threshold.

While the main disconnection switch is functioning, the line downstream of the biocomfort switch (used for the sleeping area) is powered with a continuous monitoring voltage of (5 - 230V DC). This voltage is necessary in order to restore the mains voltage (230V a.c.) at any moment, if a load is switched on. It is then possible to deactivate the main disconnection switch using a manual command if any maintenance work needs to be carried out on the electrical system.

TECHNICAL DATA		
Standard:		EN 60669-2-1
Rated operating voltage (Ue):	(V)	230 a.c. $\pm$ 10%
Rated operating current (Ie):	(A)	16
Rated insulation voltage (Ui):	(V)	250 a.c.
Rated frequency:	(Hz)	50
Monitoring voltage:	(V)	5 - 230 d.c.
Maximum lamp load:	Incandescent lamps and halogen lamps (W)	2300
	Fluorescent lamps (VA)	1000
	Lamps with electronic ballast (VA)	1000
Power loss:	(W)	0.8
Max. operating cycles:		1000/h
Closing time:	(ms)	10 - 20
Opening time:	(ms)	5 - 15
Operating temperature:	(°C)	-20...+50
Maximum cable section:	(mm²)	6

Base load

To be applied to fluorescent lamps, or loads with an absorption level less than 30 mA, according to the diagrams shown. Install directly on the load or in junction boxes. Other applications: fluorescent lamps, low consumption lamps, LED lamps, halogen lamps with transformer, dimmers and electronic transformers.

Notes

To facilitate the correct operation of the main disconnection switch, you are advised to install the minimum essential loads in the sleeping area. In fact, special attention must be paid before installing the biocomfort switch when there are dimmers or devices in standby in the sleeping area (e.g. TVs, alarm clocks, etc.): it is difficult for the main disconnection switch to pick up and disable these devices. For further information, refer to the circuit diagrams on the next page.

Circuit diagrams

Installation in the enclosure

(requiring a dedicated line for the sleeping area)

Fluorescent lamps / Low consumption lamps

Halogen lamps with 12/24V transformer

The biocomfort switch works correctly by adding the base load in parallel with the transformer, downstream from the command switch. The lamp command switch must be located upstream from the transformer (230V AC side).

Dimmers

The functioning of the biocomfort switch alongside circuits commanded by electronic dimmers is not guaranteed, but it will function with rotary dimmers (positioning the monitoring voltage selector on the maximum value). In addition, correct functioning is subject to the correct acquisition of the self-learning function by the biocomfort switch, with the minimum adjustment of the load managed by the dimmer. During normal use, load switch-on and switch-off operations must be performed in a decisive manner.

The functioning of the main disconnection switch with mechanical rotary dimmers not belonging to the Gewiss range is not guaranteed. For this reason, you are advised to install dimmers belonging to the Chorus range (GW 10 561, GW 12 561 and GW 14 561).

Loads in standby

In this case, the socket-outlet to which the load is connected must be commanded by a switch. In addition, the base load must be installed in parallel with the socket-outlet.

⁽¹⁾ 100VA resistive load⁽²⁾ 1000VA resistive load

Undercurrent protection is needed, for example, in a electrical system when a load is switched-on automatically (motor, pump, etc.) but a fault doesn't allow the operation: since the value of the current is not correct, the starting of system can be quickly stopped to avoid any damage (e.g. on a line of conveyor belts). Instead overcurrent protection is needed when there is an irregular increase of power consumption that could be the consequence of the blockage of a conveyor belt motor or the jamming of a mixer.

Circuit diagrams

Functions

Overcurrent monitoring (OVER, OVER+Latch)

When the supply voltage U is applied the output relay R switches into on-position, if the measured current is below the Max-value. When the measured current exceeds the Max-value, the output relay R switches into off-position after the interval of the tripping delay (Delay) has expired.

OVER

The output relay R switches into on-position again, if the current falls below the Min-value.

OVER+Latch

The output relay R switches only into on-position again by interrupting and reapplying of the supply voltage, provided that the measured current is below the Max-value.

Window function (WIN, WIN+Latch)

When the supply voltage U is applied, the output relay R switches into on-position, if the measured current is within the adjusted window. When the measured current leaves the window between Min and Max, the output relay R switches into off-position after the interval of the tripping delay (Delay) has expired.

WIN

The output relay R switches into on-position again, if the current re-enters the adjusted window.

WIN+Latch

The output relay R switches only into on-position again by interrupting and reapplying of the supply voltage, provided that the measured current is within the threshold values.

Undercurrent monitoring (UNDER, UNDER+Latch)

When the supply voltage U is applied, the output relay R switches into on-position, if the measured current is beyond the Min-value. When the measured current falls below the Min-value, the output relay R switches into off-position after the interval of the tripping delay (Delay) has expired.

UNDER

The output relay R switches into on-position again, if the current exceeds the Max-value.

UNDER + Latch

The output relay R switches only into on-position again by interrupting and reapplying of the supply voltage, provided that the measured current is beyond the Min-value.

⁽¹⁾ 1000VA resistive load

If the energy supplied by a three-phase system has phase imbalances due to uneven load distribution, the motor converts a part of the energy into reactive power that is lost and hence wasted, exposing the motor to big thermal stress.

Another critical condition happens with any alteration of the phase sequence during operation or from the incorrect sequence of the phases before start-up which change the direction of rotation for the devices connected as for example generators, pumps and fans.

Also the absence of a phase has a negative effect on the condition of the system, disturbing motor start-up for instance.

% values phase asymmetry adjustment

Signalling

- U green LED on: presence of power supply voltage
- Yellow LED  on/off: indication of output contact status

Circuit diagrams

Functions

Phase sequence monitoring

When all the phases are connected in the correct sequence and the measured asymmetry is less than the fixed value, the output relay switches into on-position (yellow LED illuminated). When the phase sequence changes, the output relay switches into off-position (yellow LED not illuminated).

Phase absence monitoring

The output relay R switches into off-position (yellow LED not illuminated) if one of the three power supply phases is absent.

Asymmetry monitoring

The output relay R switches into off-position (yellow LED not illuminated) when the asymmetry exceeds the value set at the ASYM-regulator. Reverse voltages of a consumer (e.g. a motor which continues to run on two phases only) do not effect the disconnection.

Electrical devices can suffer damage if they work continuously in networks with voltage levels higher or lower than the usual operating values. In case of undervoltage condition, safe start-up cannot be guaranteed or the position of the contacts of a contactor may be unsure, with the consequence that the all system becomes unstable.

Rated voltage adjustment (160÷240V L-N)

Signalling

- L1 green LED on: presence of power supply voltage L1-N
- L2 green LED on: presence of power supply voltage L2-N
- L3 green LED on: presence of power supply voltage L3-N
- Yellow LED  on/off: indication of output contact status

Circuit diagrams

Functions

Undervoltage monitoring for 3-phase AC mains with fixed threshold voltage and fixed hysteresis. All measuring inputs (L1, L2 and L3) must be connected to phase voltage. If single or 2-phase monitoring is required, unused input terminals (L) must be connected to mains voltage to have proper L-N voltage on the terminals L1, L2 and L3. A phase failure can not be detected, if the reverse voltage coming from the load exceeds the threshold U_s .

Undervoltage monitoring

The output relay R switches into on-position (yellow LED illuminated), when the measuring voltage of all connected phases exceeds the fixed threshold U_s by more than the fixed hysteresis H . When the voltage of one of the connected phases (L1, L2 or L3) falls below the fixed threshold, the output relay R switches into off-position again (yellow LED not illuminated).

PROGRAMMING

Multifunction timer

TECHNICAL DATA		
Code:		GW 96 814
Control voltage:	(V)	24...240 a.c./d.c.
Type of contact:		1 changeover
Switchover capacity:		8A - 250V a.c.
Rated frequency:	(Hz)	50-60
Timing:		0,05s...100h
Power loss:		4VA (1,5W)
Mechanical endurance:	(total N° of operations)	20.000.000
Electrical endurance:	(total N° of operations)	20.000
Switchover frequency:		max 6 per minute
Repetition precision:		< 0,5% o ± 5ms
Reset time:	(ms)	100
Degree of protection:		IP20
Operating temperature:	(°C)	-25...+55
Storage temperature:	(°C)	-25...+70
Maximum tightening torque:	(Nm)	1
Maximum cable section:	(mm²)	1 x 0.5 up to 2.5 (cable with or without terminals) 1 x 4 (cable without terminals) 2 x 0.5 up to 1.5 (cable with or without terminals) 2 x 2.5 (flexible cable without terminals)

The multifunction timer allows to connect and disconnect a load for a set period of time (adjustable from 0.05s to 100h).

Precise delay time adjustment

Operation conditions

E R Ws Wa Es Wu Bp

E: delay on activation with mains command
R: delay on deactivation with contact command
Ws: pulse on activation with contact command
Wa: pulse on deactivation with contact command
Es: delay on activation with contact command
Wu: single pulse on activation with mains command
Bp: symmetrical cycle, initial pause

Signalling

- U/t green LED on: presence of power supply voltage
- U/t green LED flashing: indication of delay time
- Yellow LED  on/off: indication of output contact status

Circuit diagrams

Functions

Delay on activation with mains command (E)

When the supply voltage is applied, the time count t begins (U/t green LED flashing). After the delay time t has elapsed (green LED on), the output relay R switches over to the ON position (yellow LED on). This status remains until the supply voltage is interrupted. If the supply voltage is disconnected before the time t has elapsed, the count is cancelled and restarts when the supply voltage is reconnected.

E

Delay on deactivation with contact command (R)

The supply voltage must always be applied to the device (green LED on). When the contact S is closed, the output relay R switches over to the ON position (yellow LED on). If the contact S is opened, the time t count begins (green LED flashing). After the delay time t has elapsed (green LED on), the output relay switches over to the OFF position (yellow LED off). If the contact S is closed before the delay time t has elapsed, the count is cancelled and restarts with the next cycle.

R

Pulse on activation with contact command (Ws)

The supply voltage must always be applied to the device (green LED on). When the contact S is closed, the output relay R switches over to the ON position (yellow LED on) and the time t count begins (green LED flashing). After the delay time t has elapsed (green LED on), the output relay switches over to the OFF position (yellow LED off). During the delay time t , the command contact can be enabled without the output relay switching over. The next cycle can only be activated when the first cycle is fully ended.

Ws

Pulse on deactivation with contact command (Wa)

The supply voltage must always be applied to the device (green LED on). The closure of the contact S has no effect on the output relay R. When the contact S is open, the output relay switches over to the ON position (yellow LED on) and the time t count begins (green LED flashing). After the delay time t has elapsed (green LED on), the output relay switches over to the OFF position (yellow LED off). During the delay time t , the command contact can be enabled without the output relay switching over. The next cycle can only be activated when the first cycle is fully ended.

Wa

Delay on activation with contact command (Es)

The supply voltage must always be applied to the device (green LED on). When the contact S is closed, the time t count begins (green LED flashing). After the delay time t has elapsed (green LED on), the output relay switches over to the ON position (yellow LED on). This status remains until the contact S is opened. If the contact S is opened before the delay time t has elapsed, the count is cancelled and restarts with the next cycle.

Es

Single pulse on activation with mains command (Wu)

When the supply voltage is applied, the output relay R switches over to the ON position (yellow LED on) and the time t count begins (green LED flashing). After the delay time t has elapsed (green LED on), the output relay switches over to the OFF position (yellow LED off). This status remains until the supply voltage is interrupted. If the supply voltage is disconnected before the delay time t has elapsed, the output relay switches over to the OFF position. The count is cancelled and restarts when the supply voltage is reconnected.

Wu

Symmetrical cycle, initial pause (Bp)

When the supply voltage is applied to the device, the time count t begins (green LED flashing). After the delay time t has elapsed, the output relay switches over to the ON position (yellow LED on) and the time t count restarts. After the time t has elapsed again, the output relay switches back to the OFF position (yellow LED off). The output relay continues to be tripped with the open/closed cycle equal to time t , as long as the supply voltage is present.

Bp

Asymmetrical timer

TECHNICAL DATA		
Code:		GW 96 815
Control voltage:	(V)	12...240 a.c./d.c.
Type of contact:		1 changeover
Switchover contact:		8A - 250V a.c.
Rated frequency:	(Hz)	50-60
Timing:		0,05s...100h
Power loss:		4VA (1.5W)
Mechanical endurance:	(total no. of operations)	20,000,000
Electrical endurance:	(total no. of operations)	20,000
Switchover frequency:		max 6 per minute
Repetition precision:		< 0,5% or ± 5ms
Reset time:	(ms)	100
Degree of protection:		IP20
Operating temperature:	(°C)	-25...+55
Storage temperature:	(°C)	-25...+70
Maximum tightening torque:	(Nm)	1
Maximum cable section:	(mm²)	1 x 0.5 up to 2,5 (cable with or without terminals) 1 x 4 (cable without terminals) 2 x 0.5 up to 1.5 (cable with or without terminals) 2 x 2.5 (flexible cable without terminals)

Asymmetrical timer allows to connect and disconnect a load according to a continuing cycle of ON-OFF periods of time with different settings (both adjustable from 0.05s to 100h).

Precise delay time adjustment

Delay time adjustment

Signalling

- U/t green LED on: presence of power supply voltage
- U/t green LED flashing slowly: indication of delay time 1
- U/t green LED flashing quickly: indication of delay time 2
- Yellow LED on/off: indication of output contact status

Circuit diagrams

U: relay supply
R: output contact

Functions

Asymmetric cycle, initial pause (Ip)

When the supply voltage is applied, the time count t1 begins (U/t green LED - slow flashing). After the delay time t1, the output relay R switches to ON (yellow LED ON) and the time count t2 begins (green LED - fast flashing). After the delay time t2, the output relay switches to OFF (yellow LED OFF). The output relay continues to trigger in the times set by t1 and t2, as long as there is a supply voltage.

The output relay continues to switch between ON and OFF with times t1 and t2 until the supply voltage is disconnected.

Ip

Asymmetric cycle, initial pulse (Ii)

When the supply voltage U is applied, the output relay R switches to ON (yellow LED ON) and the time count t1 begins (U/t green LED - slow flashing). After the delay time t1, the output relay switches to OFF (yellow LED OFF) and the time count t2 begins (U/t green LED - fast flashing). After the delay time t2, the output relay switches to ON (yellow LED ON). The output relay continues to trigger in the times set by t1 and t2, as long as there is a supply voltage.

The output relay continues to switch between ON and OFF with times t1 and t2 until the supply voltage is disconnected.

Circuit diagrams

MODULAR ACCESSORIES

Function

Steady light OFF

Steady light ON

Retrigger (time extension)

If the pushbutton is pressed again before the interval t has expired, the interval t begins again.

Pumping

Rapid and multiple pressing of the pushbutton adds 2, 3 or more time intervals to extend the time up to 60min.

Risparmio energetico

Prolonged pressure on the button ($>2s$) aborts the interval running and switches the light off.

Analogue time switches

Analogue voltmeters and ammeters

Indicator instruments of the electromagnetic type made up of a movable coil element. The voltmeter is the direct activation type, with a scale of 0-300/0-500V. The ammeters of 10 - 20 - 30A capacity use direct activation, whereas the GW 96 878 ammeter allows the measurement of currents up to 1500A thanks to the use of the appropriate TA and relative scale.

Digital voltmeters and ammeters

The digital tools with completely electronic operation ensure high precision and a long lifespan, thanks to the absence of moving mechanical parts subject to wear and tear. The measurement is displayed by means of a digital multiscale display. The ammeters are fitted for capacity selection using the front push-button.

The current transformers (.../5) must have a primary current equal to the capacity pre-set on the tool.

Current transformers

TECHNICAL DATA		
Standards:		EN 61869-1, EN 61869-2
Secondary current:	(A)	5
Rated frequency:	(Hz)	50-60
Test voltage:		6kV at 50Hz for 1 min.
Overload:		1.2 I _n
Dynamic shorting current:		2.5 I _{th}
Safety factor:		< 5
Degree of protection:		IP30
Operating temperature:	(°C)	-20...+50
Storage temperature:	(°C)	-40...+80
Relative humidity:		80%
Maximum cable section:	(mm ²)	10

Bell transformers (for discontinuous use)

TECHNICAL DATA		
Standards:		EN 61558-1, EN 61558-2-8
Primary rated voltage:	(V)	230 a.c.
Secondary rated voltage:	(V)	4+8=12 / 12+12=24
Secondary voltage change at full load:		15%
Insulation class:		II
Rated power:	(VA)	6 - 10 - 15 - 30 - 40
Degree of protection:		IP20
Operating temperature:	(°C)	-10...+40
Maximum cable section:	(mm ²)	6

Applications

Thanks to intermittent operation, the bell transformers can be used to actuated the shunt trip release 96 GW 011 with rated voltage $V_n=12/24V$. The following table shows the maximum number of releases GW 96 011 actuated by bell transformer.

Transformer code	Secondary voltage (V)	Rated power (VA)	Max n. of releases GW 96 001 actuated
GW 96 425	12	15	5
GW 96 426	12	7,5	3
	24	15	2
GW 96 431	12	30	11
GW 96 432	12	15	7
	24	30	6
GW 96 433	12	40	12
	12	20	8
GW 96 434	24	40	7
